

JMeter Summary

JMeter result showed a general cut off in connection if attempting too many HTTP requests in a row. If a large amount of requests (100) were sent, only about 10-20% were processed. This leads me to believe there's a firewall in Azure protecting the website from a DDoS attack, or the code written to handle the requests on the website should be optimized. When only a small batch of requests were sent (1-10) no such issues would generally occur.
